

Small Home Office Network Design / Network home lab

The above screenshot shows the Omada Controller, which serves as the central management platform for the established network where networking devices are adopted and managed. As shown in the image, both the router and access point have been adopted into the controller and can also be accessed through a mobile device. These devices are managed under the TP-Link Omada ecosystem.

On the other hand, the managed switch utilizes a separate management interface from the Omada Controller. Although the switch is also a TP-Link device, it is not Omada-compatible and therefore cannot be adopted or centrally managed through the Omada Controller. As a result, switch administration and configuration must be performed through its dedicated management interface.

802.1Q VLAN Status: EnableApply

802.1Q VLAN Setting

VLAN (1-4094): 10

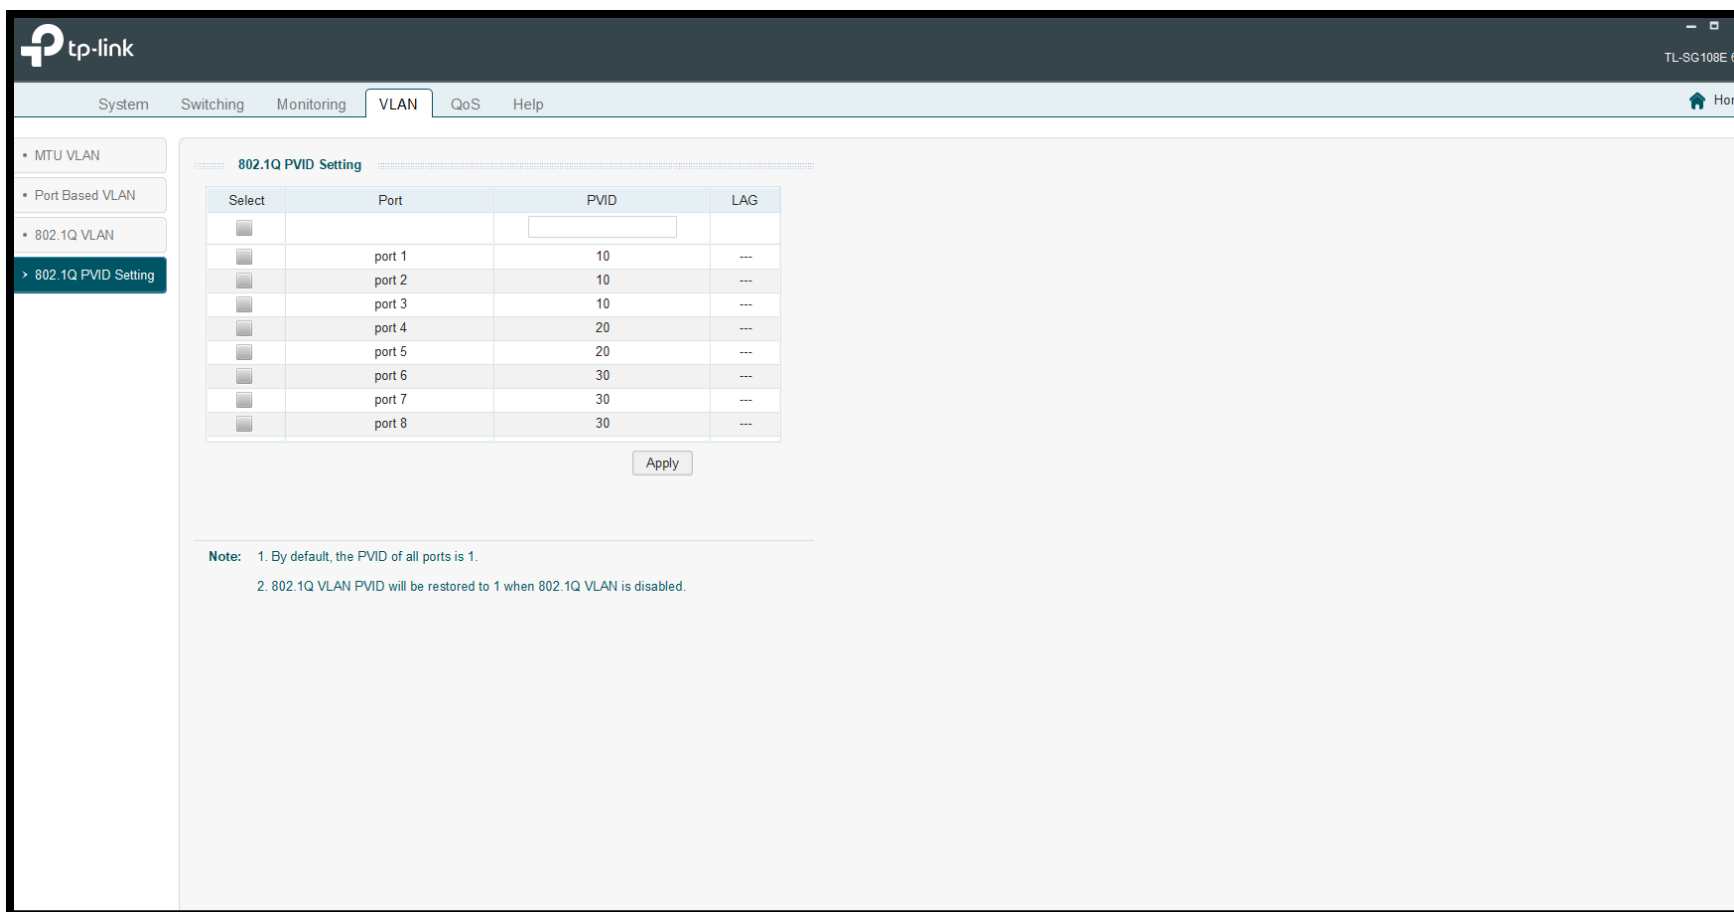

VLAN Name: RickTech

Tagged Ports: 12345678

Untagged Ports: 12345678Apply

VLAN	VLAN Name	Member Ports	Tagged Ports	Untagged Ports	Delete VLAN
1	Default				
10	RickTech	1-3		1-3	Delete
20	Home	1-5	1-3	4-5	Delete
30	Work	1-3, 6-8	1-3	6-8	Delete

A. SC1

B. SC2

In **Figure A (SC1)**, the screenshot displays the switch port assignments, including the trunk port configuration that enables proper communication across multiple VLANs and network segments.

In **Figure B (SC2)**, the screenshot illustrates the VLAN configuration implemented on the switch. The configuration is responsible for assigning unique VLAN IDs to their corresponding network segments, ensuring proper traffic segregation and alignment with the designated subnet structure.

This configuration supports the separation of administrative, home, and work networks while maintaining connectivity throughout the network infrastructure.
