

Alert 8817: Phishing

- Identified as True Positive
- Requires escalation to L2
- Full Report Documented on the last page

SIEM Investigation

- For reference: SIEM Logs show that there are no file attachments.

Playbooks used:

Phishing Email Analysis

This playbook provides step-by-step guidelines for SOC Level 1 analysts to investigate suspected phishing emails reported by end users or detected by security tools. Phishing emails aim to trick recipients into revealing sensitive information, downloading malware, or visiting malicious websites. Timely and accurate triage is essential to determine the threat level, contain any risk, and escalate as needed.

Submitted report:

-Time of Incident: 12/01/2025 11:55:36.520

-User Involved: [h.harris@thetrydaily.thm]

-Device: Email system (inbound email)

-Incident Details: At 12/01/2025 11:55:36.520, an inbound email with the subject "Your Amazon Package Couldn't Be Delivered – Action Required" was received from `urgents@amazon.biz`. The email contains an external link `http://bit.ly/3sHkX3da12340` that attempts to solicit sensitive information under the guise of a package delivery issue. Investigation should include reviewing firewall or proxy logs to confirm whether any endpoint attempted to access the URL and whether the connection was allowed or blocked.

-Malware Identified: None identified. Confirmed phishing email.

Additional Investigation:

-Why This Is Uncommon: Receiving emails with external links from domains not associated with the organization, especially shortened URLs claiming urgent actions, is unusual and aligns with common phishing tactics.

-Recommendations: Escalate to Level 2 (L2) for further investigation and ensure no endpoints accessed the malicious link.

-This is a True Positive

-This needs escalation to L2 for further investigation
